

Copy Protect WebMail & Tutorials

The SafeGuard WebMail service can be used anywhere including Facebook.
Safe from sharing and all copy including screen shots and video recorders.

The most secure solution for team messaging and online tutorials.

SafeGuard WebMail

The SafeGuard WebMail service provides the most secure solution for online courses and team messaging where nothing can be shared or copied in any way. By using SafeGuard WebMail tutors don't even need a website and can create lessons and manage students from any device connected to the Internet.

SafeGuard WebMail provides an online page editor for formatting text, embedding images and adding PDF, MP4 and ZIP files as attachments. Students and team members can then be invited by email to read and discuss messages in a most secure Webmail type environment.

Tutors have total control over who reads, how long for, how many times and via which device. Any changes made are effective immediately. For example a tutor can change the message that every recipient sees at any time, remove it completely or simply add/remove the eligible recipients.

SafeGuard WebMail messages cannot be copied or shared in any way, not even if a subscriber shares their password, because tutors (team leaders) can limit accounts to any number of devices (1-10) that are recognised by unique identifiers.

SafeGuard WebMail Requirements

No website is required to use this service. While the SafeGuard WebMail messaging service can be likened to a secure Webmail portal, it can also serve as a most securely copy protected solution for the management and assignment of online courses.

Secure Team Messaging

Ideal for team messaging or private tuition where the privacy and security for intellectual property is paramount. All messages and attached media is accessed via an online mail client. Nothing leaves the server except if notification of new messages is required to the recipient's usual email address.

Online Course Management

Each admin/author can create an unlimited number of groups, users and messages which are published as web pages and can include HTML and embedded images, PDF, video and zip files can be attached for additional reading in a secure, copy protected scenario which is read-only (no copy).

User Management

SafeGuard WebMail provides the most sophisticated and most secure DRM imaginable, where access is limited not only by password protection, but also by unique computer identification, enabling accounts to be locked to 1 or several computers.

Management Controls

User access can be governed by Group settings and/or individual settings to include:

Subscription Sales

Sell subscriptions online from any web page or Facebook post. Add products for the link to use on any web page to sell your eBooks and tutorials free of commission or advertising fees. All you need is your own PayPal account and your customers can use any credit card without subscribing to Paypal.

Management Controls

User access can be governed by Group settings and/or individual settings to include:

- Access to messages/pages assigned per Group with white-listing for associated groups/courses.
- Groups and users can be expired by calendar date.
- Access to messages limited by expiry date, expiry by days or expiry by views.
- QA responses easily managed from stats and notifications for time read by each recipient.
- Send messages like normal Webmail using TO, CC and BCC protocols.
- Edit/recall sent messages at any time.
- Changes to messages or user settings have immediate effect on messages already in Inboxes.
- Limit use access by network address or IP range. Ideal for intranets.
- Watermarks can be applied to message pages, including attached PDF and video.
- Sell subscriptions using a link on any web page free of commission and fees.

Copy Protection

SafeGuard WebMail utilises the most secure copy protection for web media on the planet:

- Access to messages/pages assigned per Group with white-listing for associated groups/courses.
- Messages are DRM protected for access limitations that cannot be shared or spoofed.
- Messages on display are securely protected from all copy including PrintScreen and recording.
- Nothing leaves the SafeGuard WebMail server and the user's view is "read-only".
- Only ArtisBrowser can decrypt and display the encrypted messages. Other browsers get nothing.
- Nothing can be gained by view-source and packet-sniffers get nothing.

How It Works

Whether a tutor or team leader you can create messages assigned to Teams/Groups that can be accessed by each user in those Teams/Groups, or you can send messages to specific recipients. Recipients can reply and follow discussions with anyone that was included as a TO or CC recipient. It all starts with the Team leader who can keep it one-one one by using BCC or they can include others as required by using CC... each user's contact list begins with only one contact for their welcome message, and additional contacts are added automatically when found as either a TO or CC recipient for a message.

Free Demo Account

Demo accounts can be registered for the SafeGuard WebMail service with access for 14 days:

- Demo accounts expire in 14-days from start date.
- Contact-lists are limited in that new users are automatically added from Senders.
- Use of this service requires full agreement to our Terms of Service.
- Click to register a trial account at https://safeguard.media/mail/account_join.asp

SafeGuard WebMail Pricing

Pricing for the SafeGuard WebMail service is based on user count:

- Account setup fee is US\$25 (non-refundable).
- At the end of the month your account will be billed \$1/user in your account base.
- An invoice will be emailed with 14 days to pay.
- Payment can be made online by PayPal or credit card.
- Failure to pay within 14 days will result in immediate suspension of the account.
- Use of this service requires full agreement to our Terms of Service.
- Click to purchase an account at <https://safeguard.media/wordpress-protection-order.asp>
